

gitutils Cheat Sheet

by leonardo hax damiani via cheatography.com/90404/cs/20472/

Gitutils

Gitutils is a tool to facilitate server-side operations when developing software that uses git repositories. It allows users to create forks and merge requests directly from the command line interface.

FORK: Fork existing repositories into your own personal space. Doing a fork is strongly recommended to freely experiment your changes and/or development in a safe working space without affecting the original project.

MERGE: Merge existing repositories from your personal space into the original repository. Merge has the purpose of joining different repositories to incorporate changes into repository.

for the full documentation: gitutils.readthedocs.io/en/latest/

Installation

Use *conda* to install the latest stable version of Gitutils: conda install -c paulscherrerinstitute gitutils

Gitutils is compatible with Python 3.5+.

Fork examples

Fork and clone: gitutils fork <group_name>/<repo_name>

Fork and not clone: gitutils fork <group_name>/<repo_na-</pre>

Fork, clean and clone: gitutils fork <group_name>/<repo_name> -c

Fork, clean and not clone: gitutils fork <group_name>/<r-epo_name> -c -n

Merge examples

merge (default title and description): gitutils merge

merge (from project's directory): gitutils merge -t <title>
-d <description>

merge: gitutils merge -p <group_name>/<repo_name> -t
<title> -d <description>

if -p is not indicated, gitutils fetches project from the .git/config file.

Gitutils arguments

-h Shows the help message and exit

(help):

Allows the user to change the endpoint of the git server.

(endpo- Default: https://git.psi.ch

int):

-е

Usage:

gitutils -h

gitutils -e https://my-git-server.ch <fork_or_mer-</pre>

ge>

Fork arguments

-n (no Indicates that the forked project will not be cloned after clone): forking. A fork will be created on the server-side and no

clone nor upstream will be generated on the local git

server.

-c Indicates to delete any existing fork project under your (clean): personal group. This might be necessary to fork and clone

into a clean copy of the original repository. The desired forked project must not be a pre-existing forked project

under your personal projects.

To see the help message for fork: gitutils fork -h

Merge arguments

-p (project): Indicates the project to be forked.

-t (title): The title of the merge request that is going to be

created.

-d (descript- The description of the merge request that is going to

ion): be created.

To see the merge help message: ${\tt gitutils\ merge\ -h}$
